It is instructive to note the relation of the refrigeration process to the second law of thermodynamics. (See Art. 1177, Heat.) This law asserts that heat can not pass from a cold to a hot body by a self-acting process unaided by external agency. In other words, whenever heat is transferred from a body to a warmer body, there must be some work expended to effect the transfer. In the process described above, the refrigerating-machine is the agent used in transferring the heat from the refrigerating room to the condensing water, and the work expended by the machine on the fluid is that required in the transfer. The transfer of heat may be expressed algebraically as...
